

JS-586-Demonstration
Owner Progress Page
Mentor/Supervisor: Jeffry Susanto
Canvas Group ID: JS586

Setting up the test environment

[1.0] How to login into the Woofya app:

Navigate to the link: <https://woofya.com/app/signin>

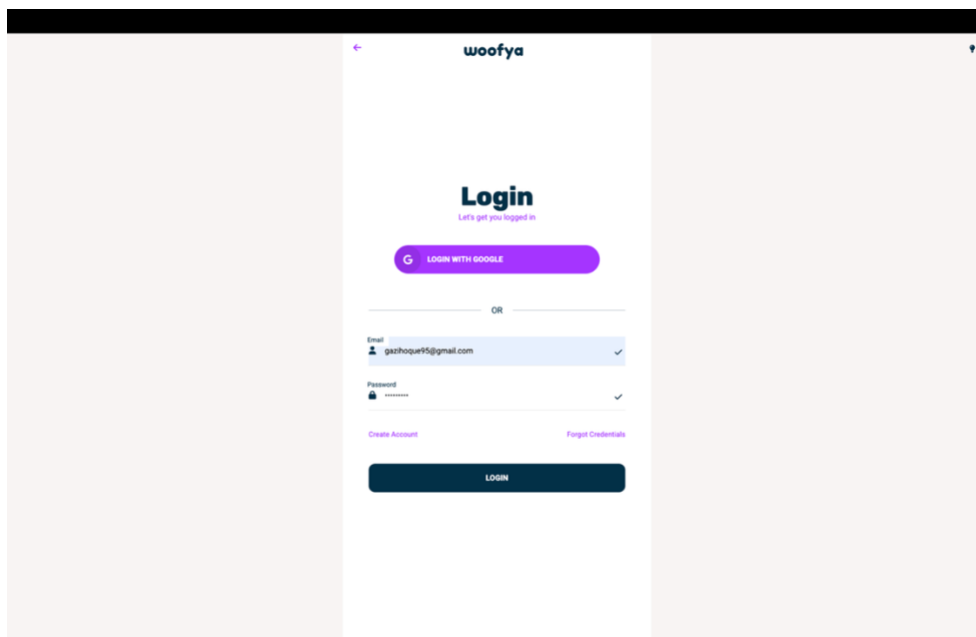

[2.0] Enter Credentials to login: defined in the credentials.txt

You might be thinking why can't you create your own account and test it? At the time of 31/10/2025 all new users are not allowed to join any new challenges. In this situation you need to join a challenge with an account that has pre-existing account which has signed up before. It will have challenge and goal cards that you can test.

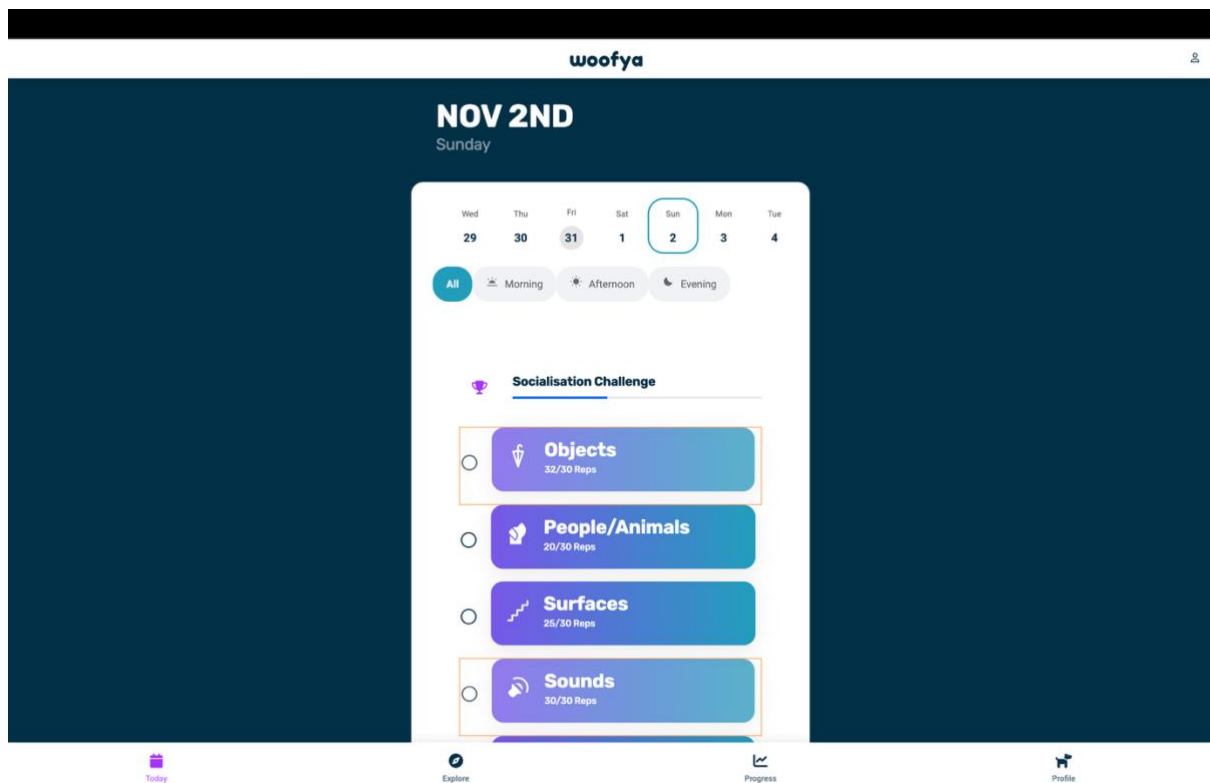

Email: gazihoque95@gmail.com

Password: Gizmo@159

[3.0] Viewing the Dashboard

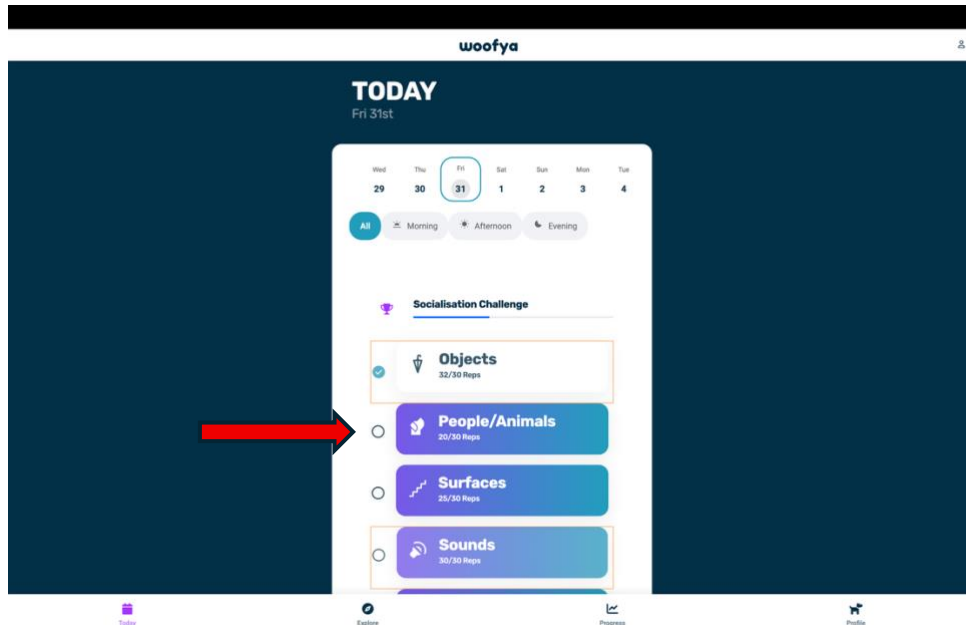

When you access the dashboard, you can view the challenges. In this screenshot one of the challenges are called “Socialisation Challenge.” You can view the goal cards (rainbow) which you can select in the instance you want to test the data.

Creating Sample Data (for testing our application)

[4.0] Selecting a challenge Card

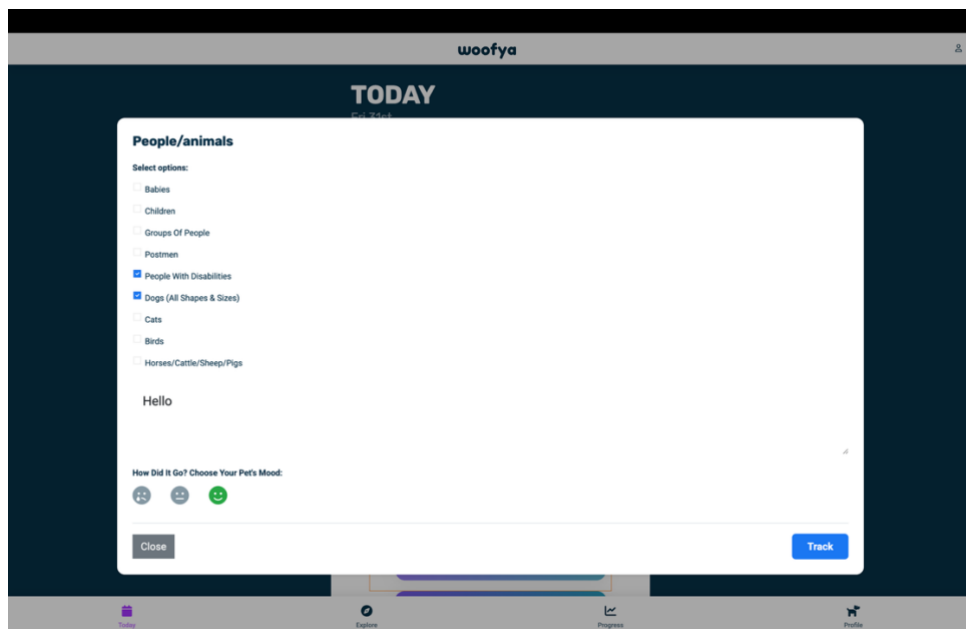

When you select a challenge card, it will show a pop-up.

[5.0] Creating Sample Data

When you select a People / Animal card. You can fill in the checkboxes, create a comment, and select a mood. Once you're done, select the "Track Button"

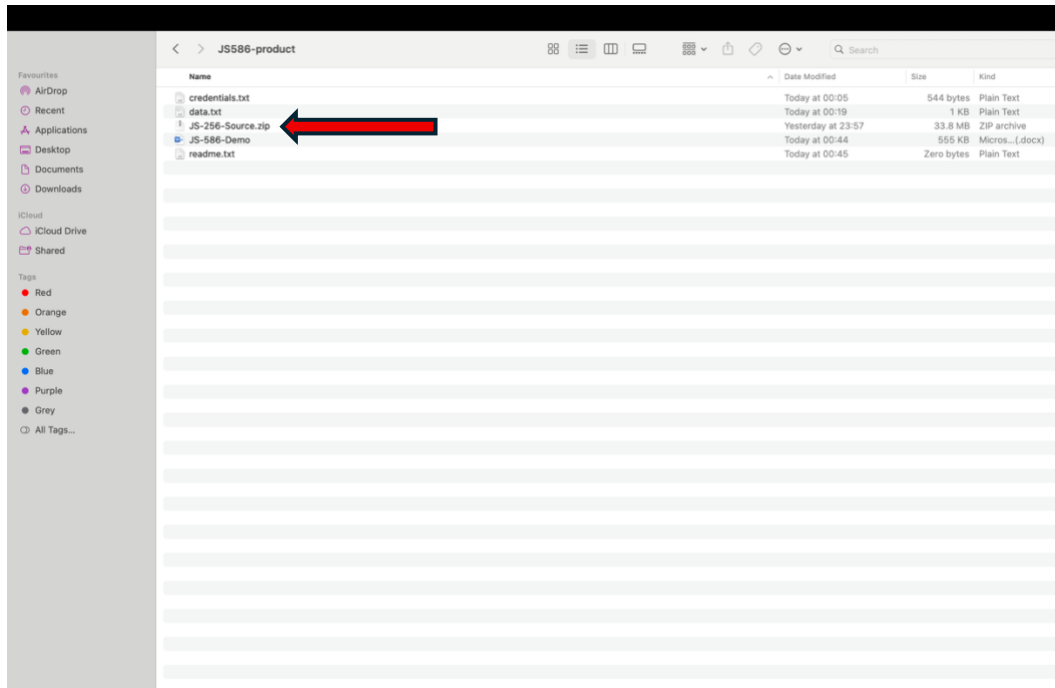

Note: do this since this will be necessary to test in the front-end

Accessing the Application locally

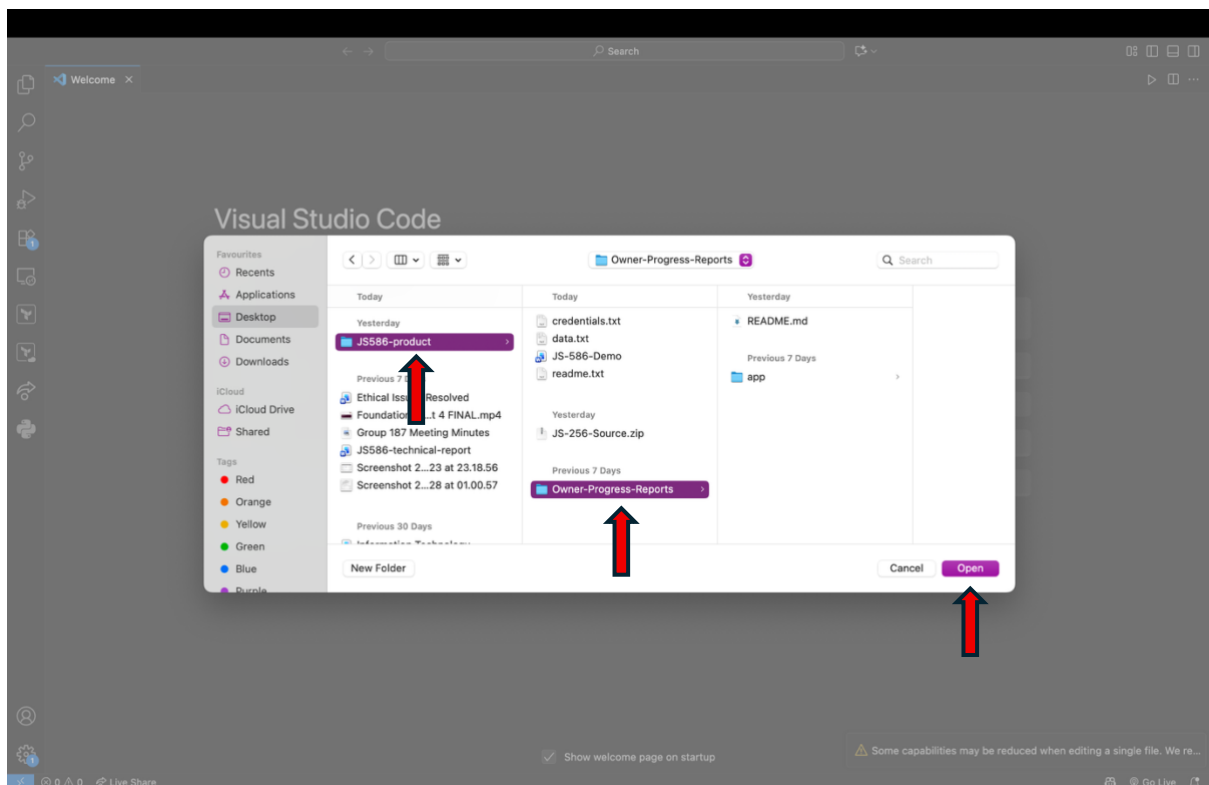

[6.0] Unzipping the source code

For testing locally, you should open the source code zip file and open the file in VSCode.

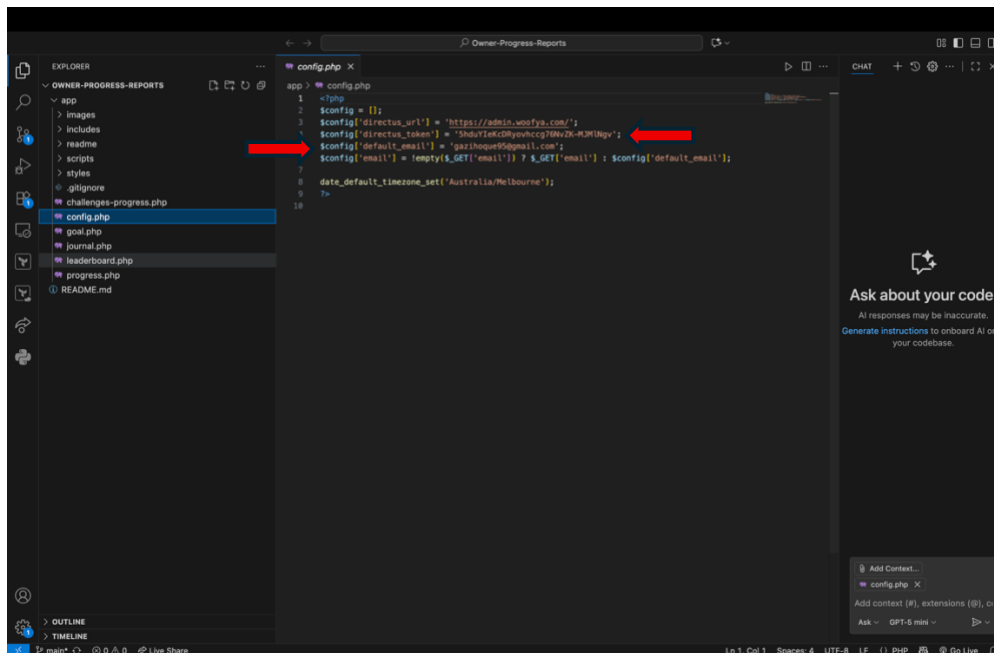

[7.0] Open the application in VSCode

Open a new window on VScode, select Open new file and navigate to "Owner Progress Reports" directory and open the directory.

[8.0] Configuring the config.php file

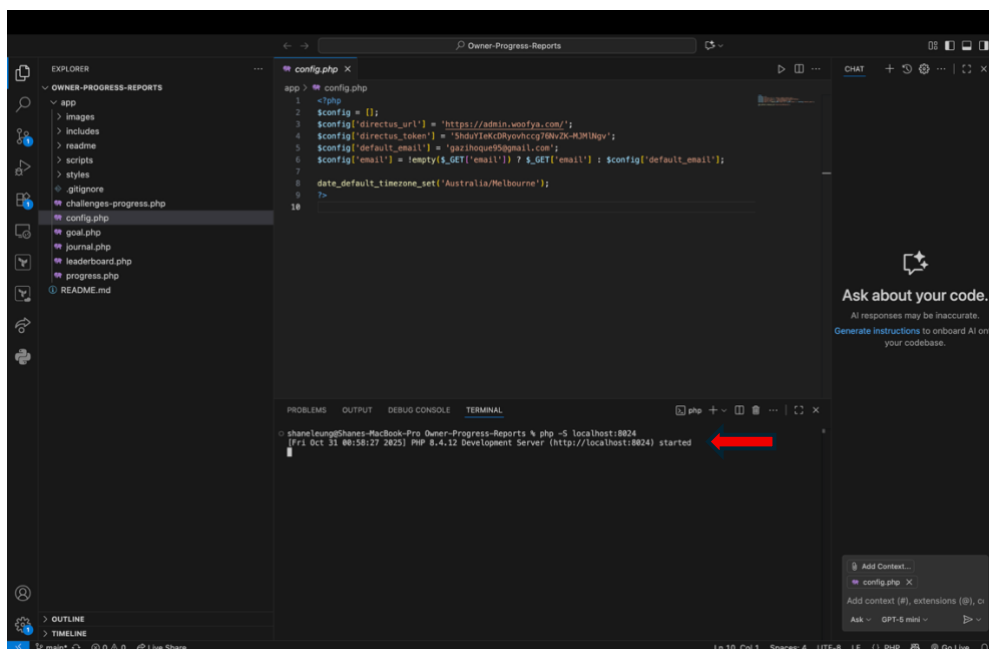

To run the application locally, referring to the credentials.txt file (but also its pre-configured in the repository already), fill in the default email and the API key you wish to use for the testing. If you're unsure then refer to the readme file in the root directory.

[8.0] Accessing the Application

Open a new terminal in vs code and navigate to the root directory of the file.

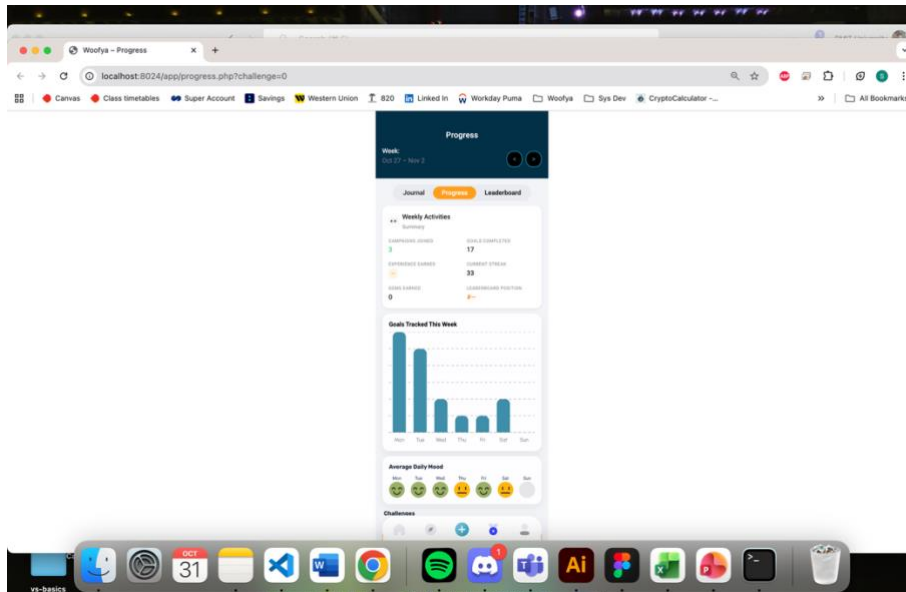

To run the application locally (via php) type the following command: `php -S localhost:8000`

[9.0] Accessing the application via the browser

Open your browser, navigate to: `localhost:8000/app/progress.php`

note: the to index is because our application is following the same file structure as the clients. In their repository they have an index page existing for the login. We want to ensure that the file structure reflects what we see in the production repository

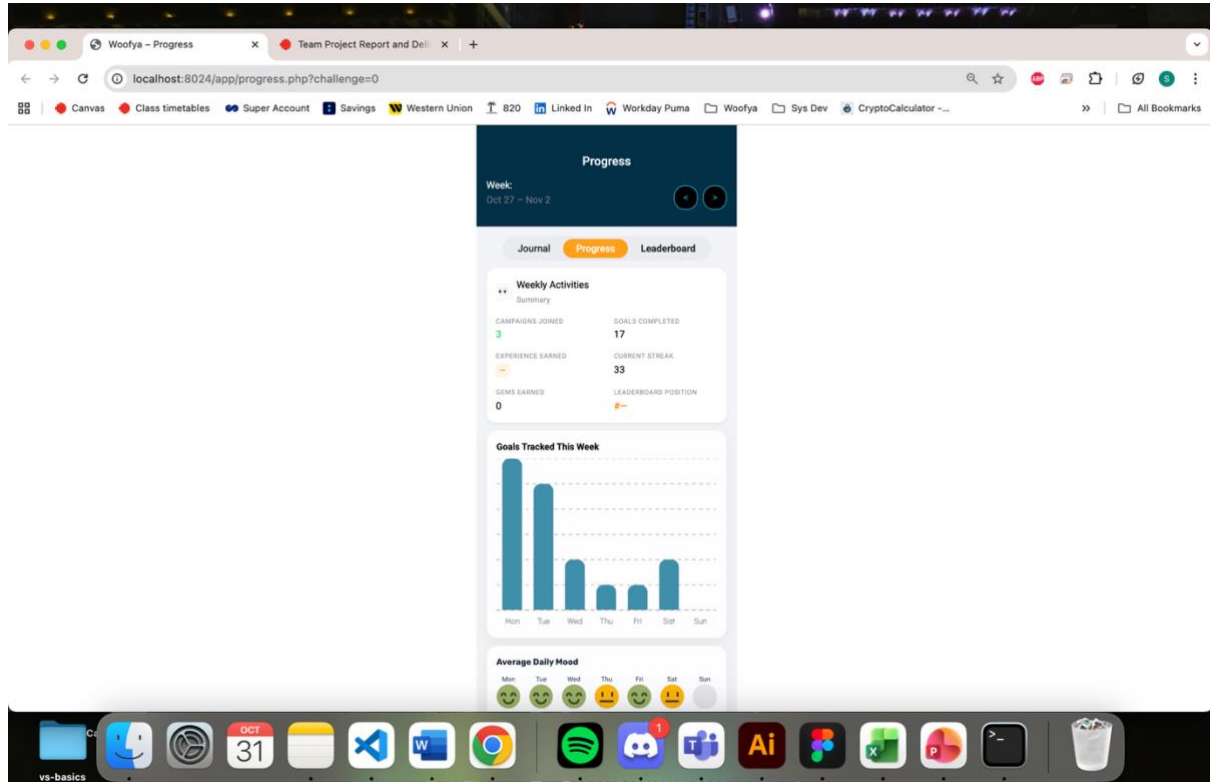

Testing the application

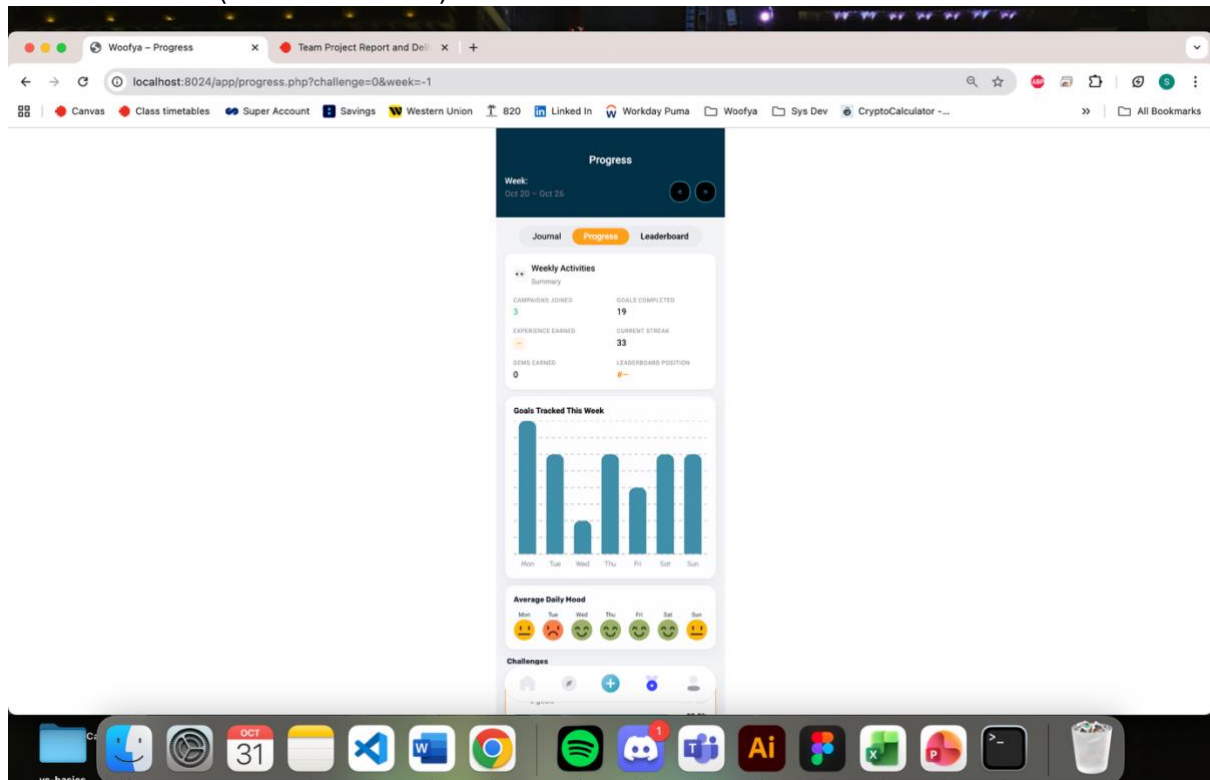

[10.0] Testing the navigation weekly filter: Progress

In this test we're on the progress page and we're testing the whether the "<" and ">" located in the navigation bar works.

Current week (Oct27 – Nov2):

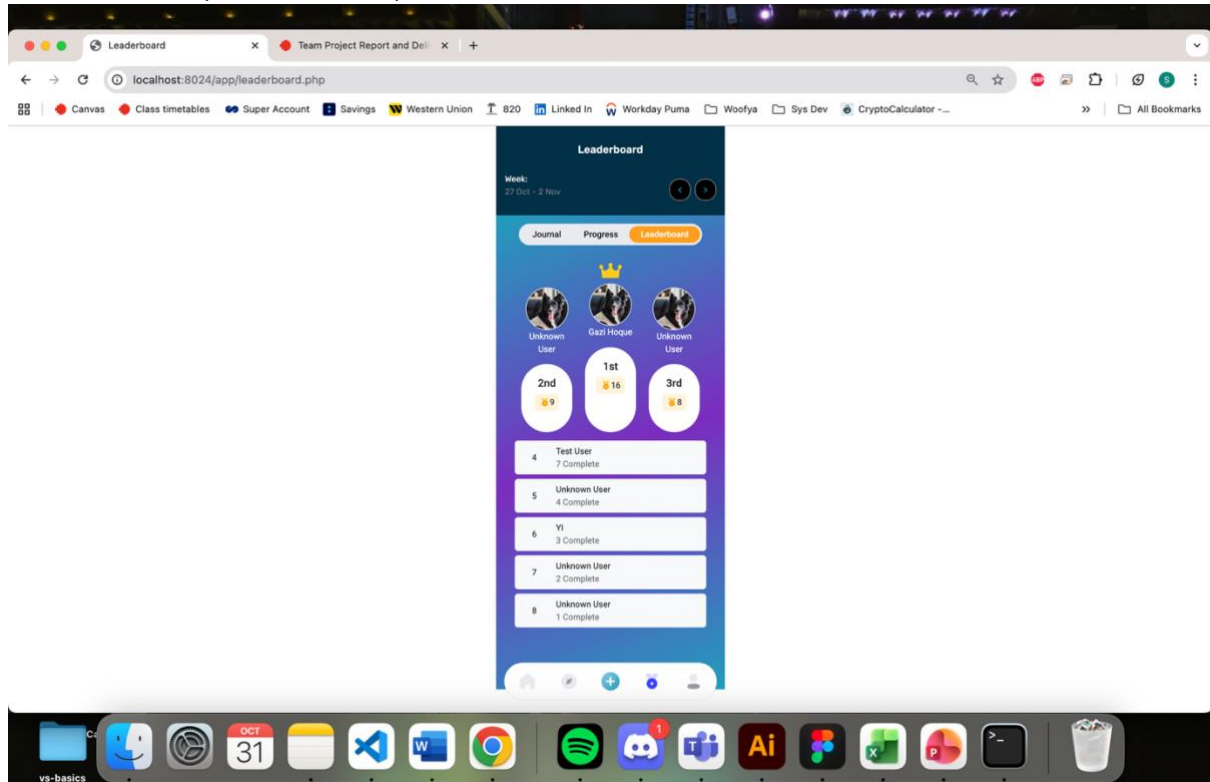

Previous Week (Oct 20 – Oct 26):

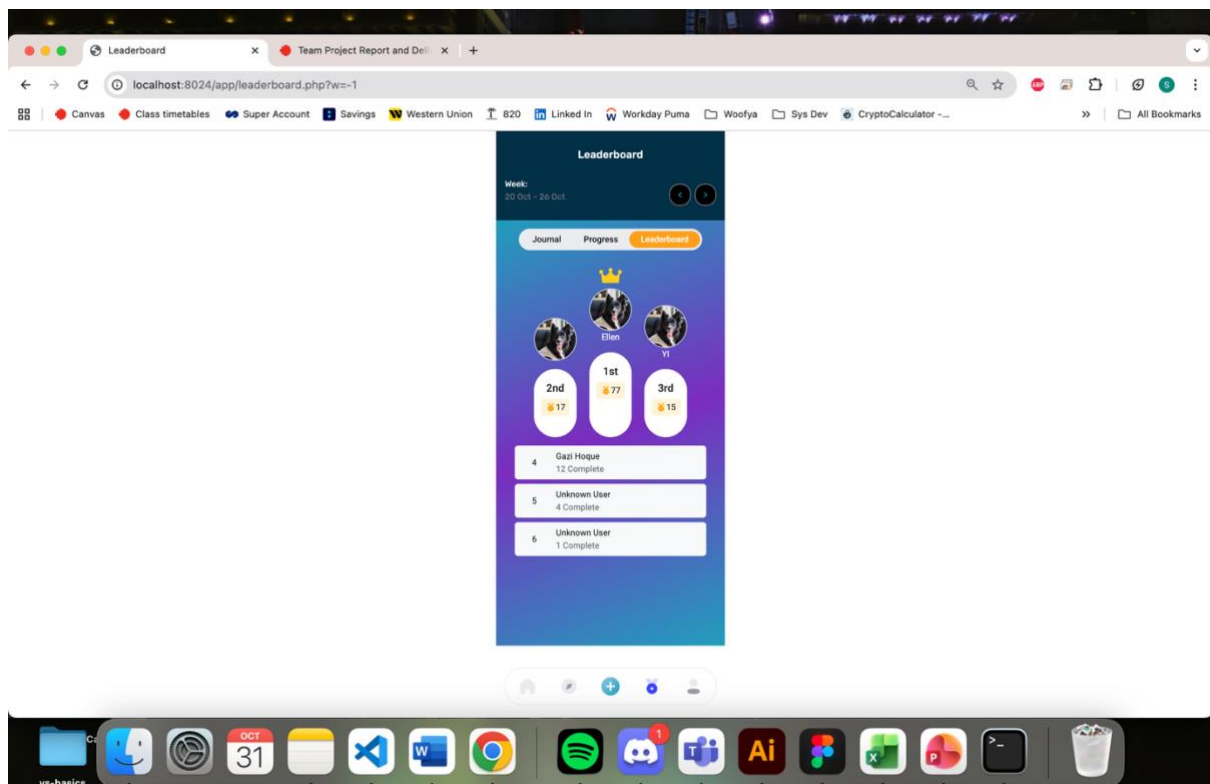

[11.0] Testing the navigation weekly filter: Leaderboard

In this test we're on the leaderboard page and we're testing the whether the "<" and ">" located in the navigation bar works.

Current week (Oct27 – Nov2):

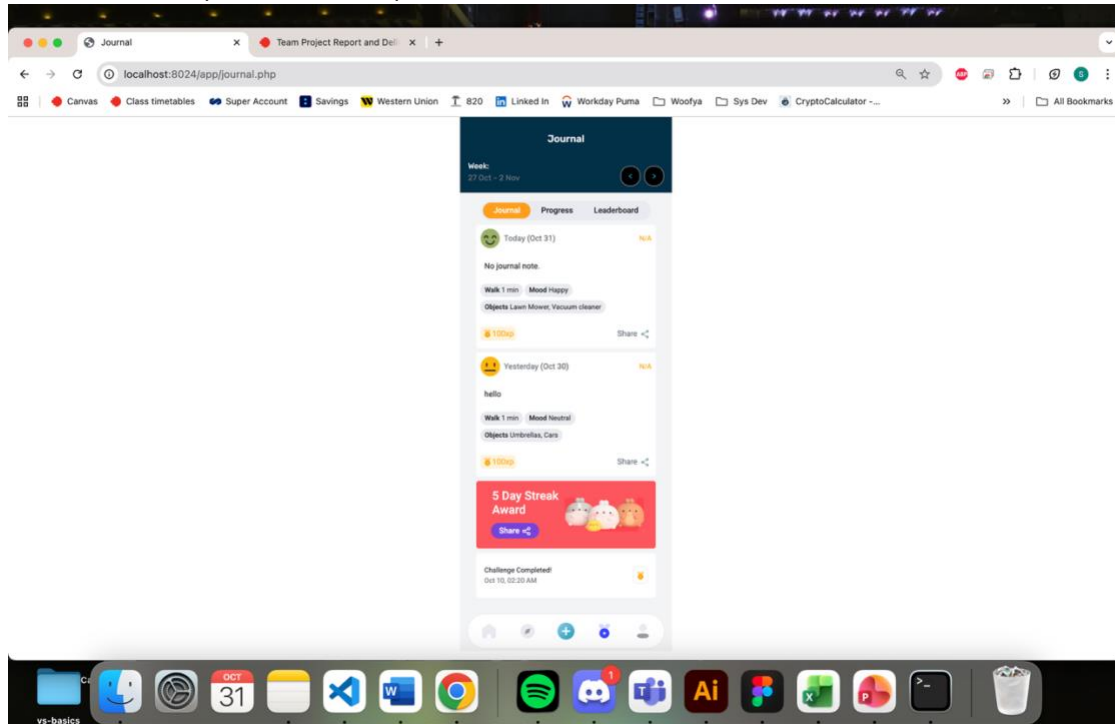

Previous Week (Oct 20 – Oct 26):

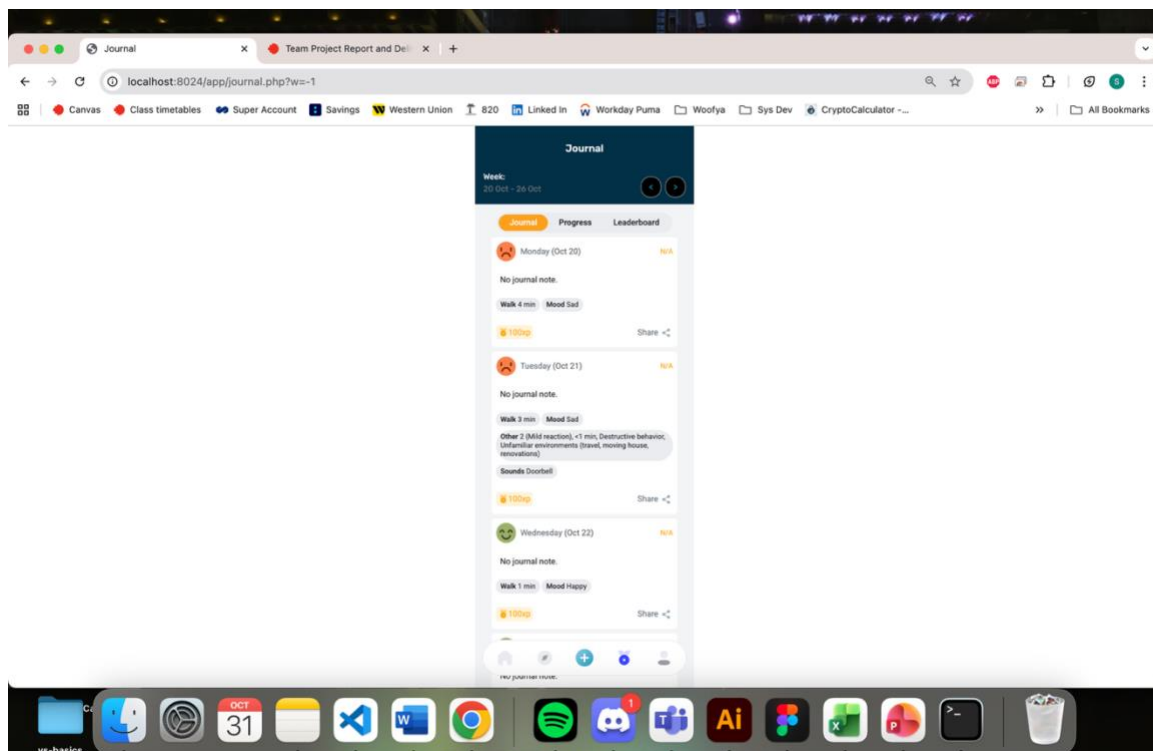

[12.0] Testing the navigation weekly filter: Journal

In this test we're on the Journal page and we're testing the whether the "<" and ">" located in the navigation bar works.

Current week (Oct27 – Nov2):

Previous Week (Oct 20 – Oct 26):

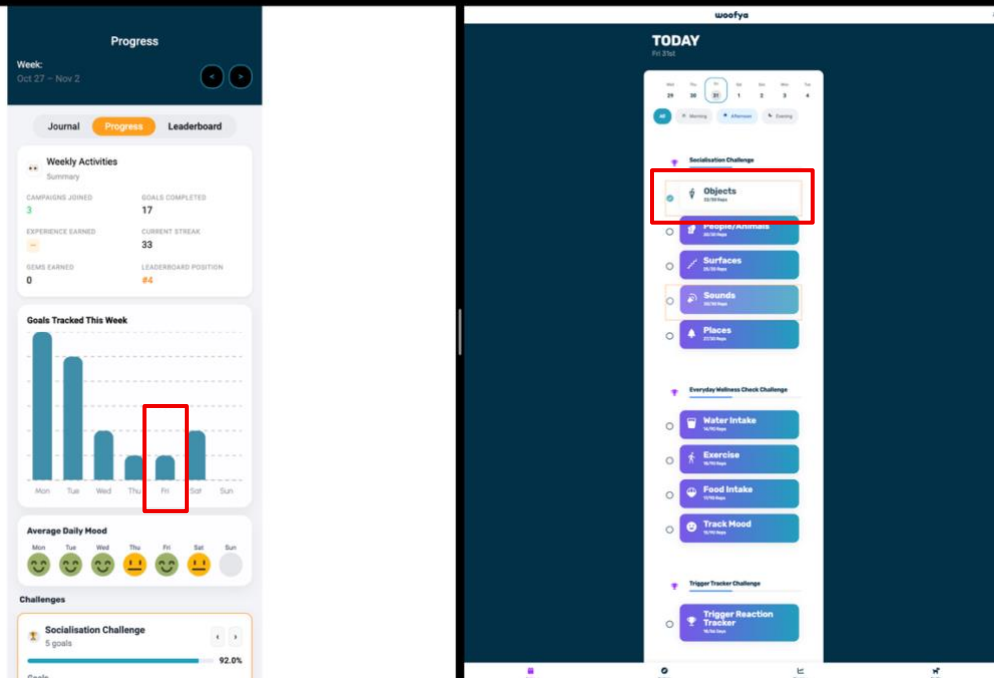

[12.0] Testing the “Goals tracked this week” chart: Progress

In this test we’re going into the application and matching the tally of goals entered for a particular day in a week. We need to match the dashboard goals entered with the chart tally.

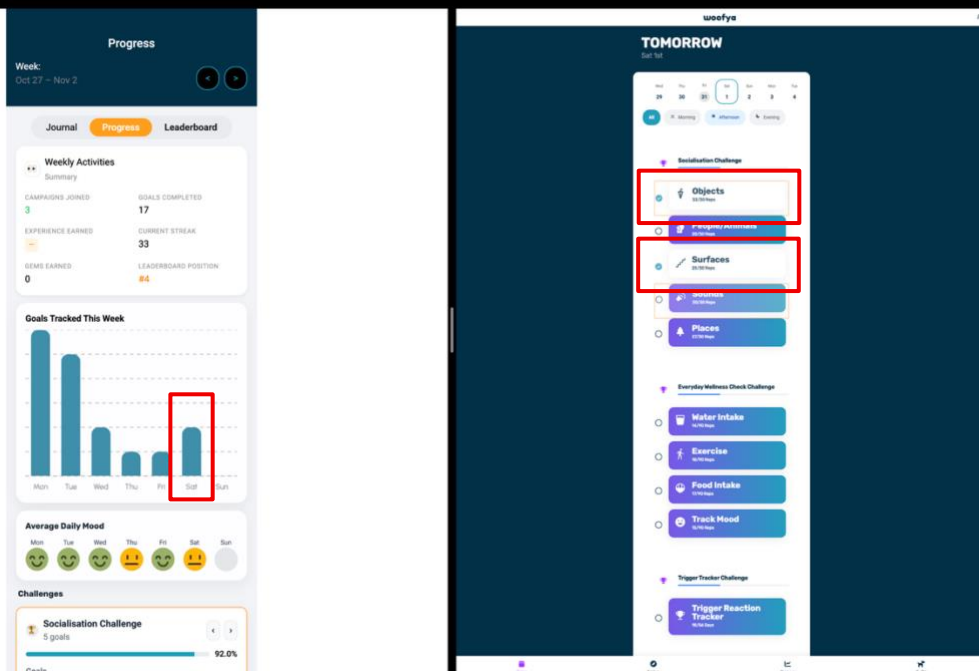

Friday 31st October Test:

Progress Page tally = 1, Dashboard Tally = 1

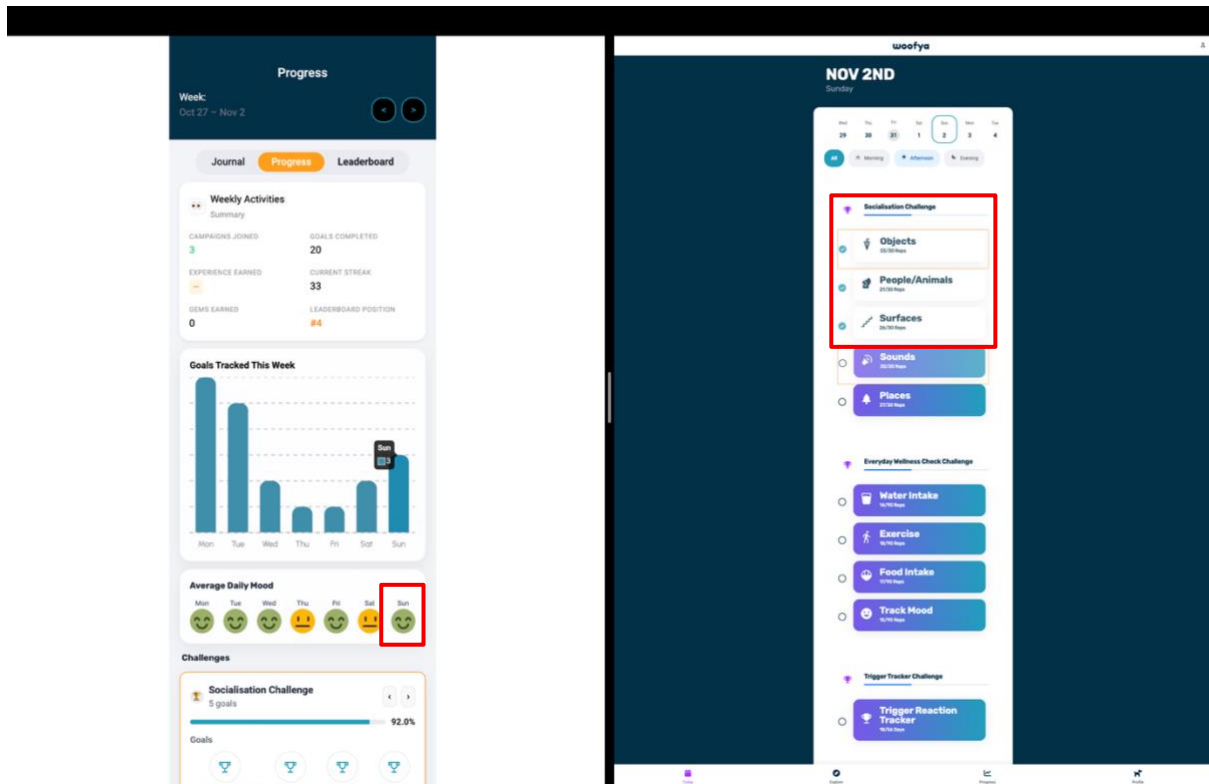

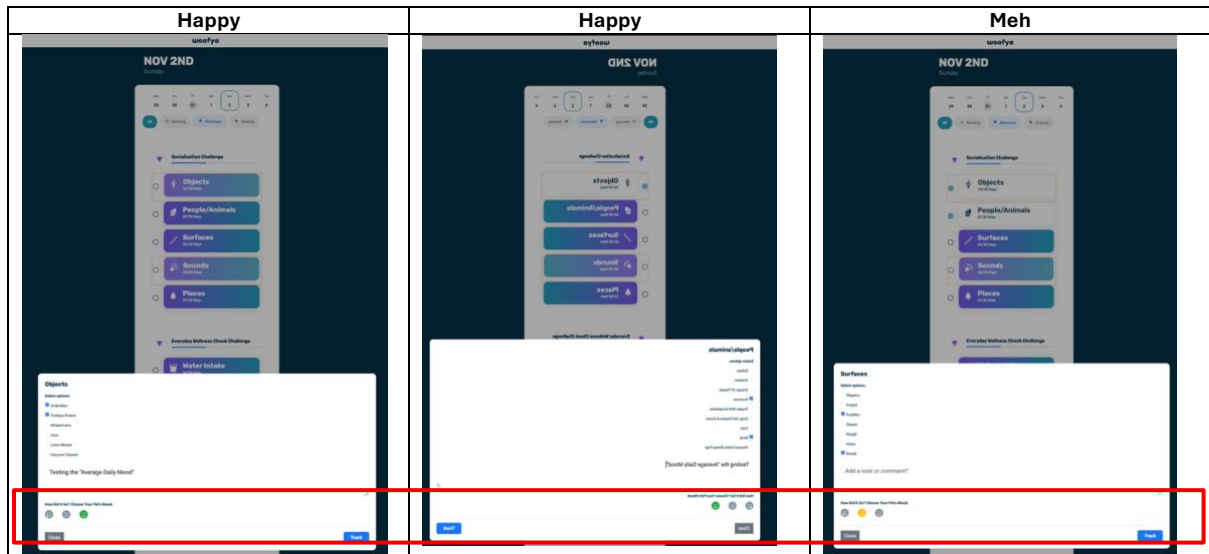

Saturday 1st November Test:

Progress Page tally = 2, Dashboard Tally = 2

[13.0] Testing the “Average Daily Mood”: Progress

In this test we’re evaluating the average daily mood component in the progress. We will generate data on the 2nd of November with 2 happy faces and 1 meh face. The test will be successful if we can identify a happy face at the end of the day.

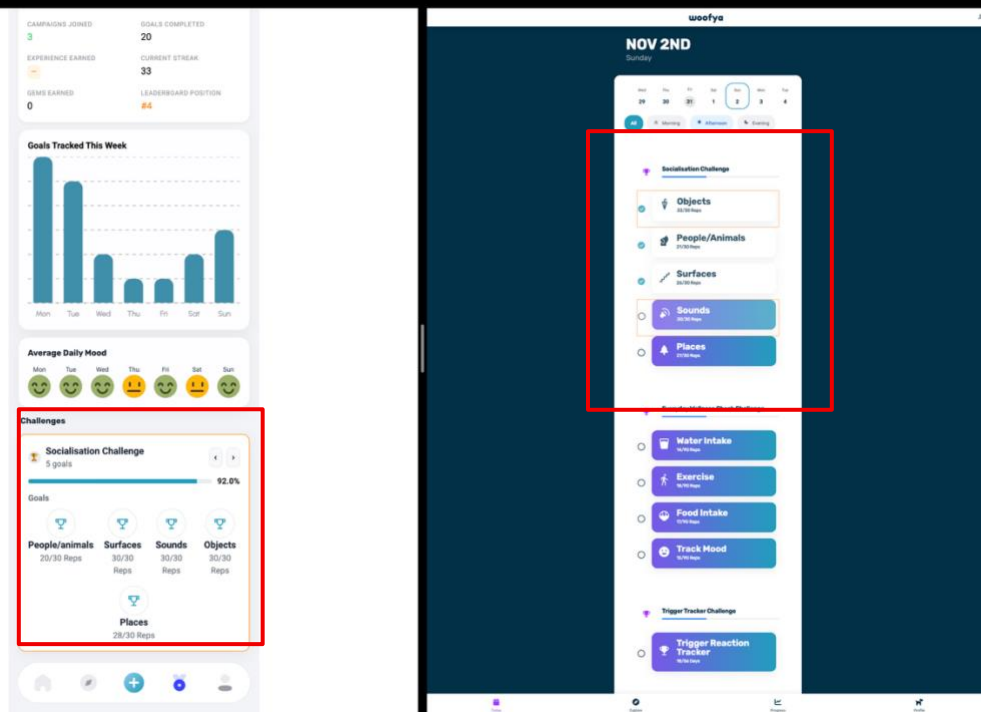

[14.0] Testing the “Challenge” Card Component: Progress

In this test we’re matching the data shown in the dashboard (goal tally’s) with the challenge card shown in the progress page.

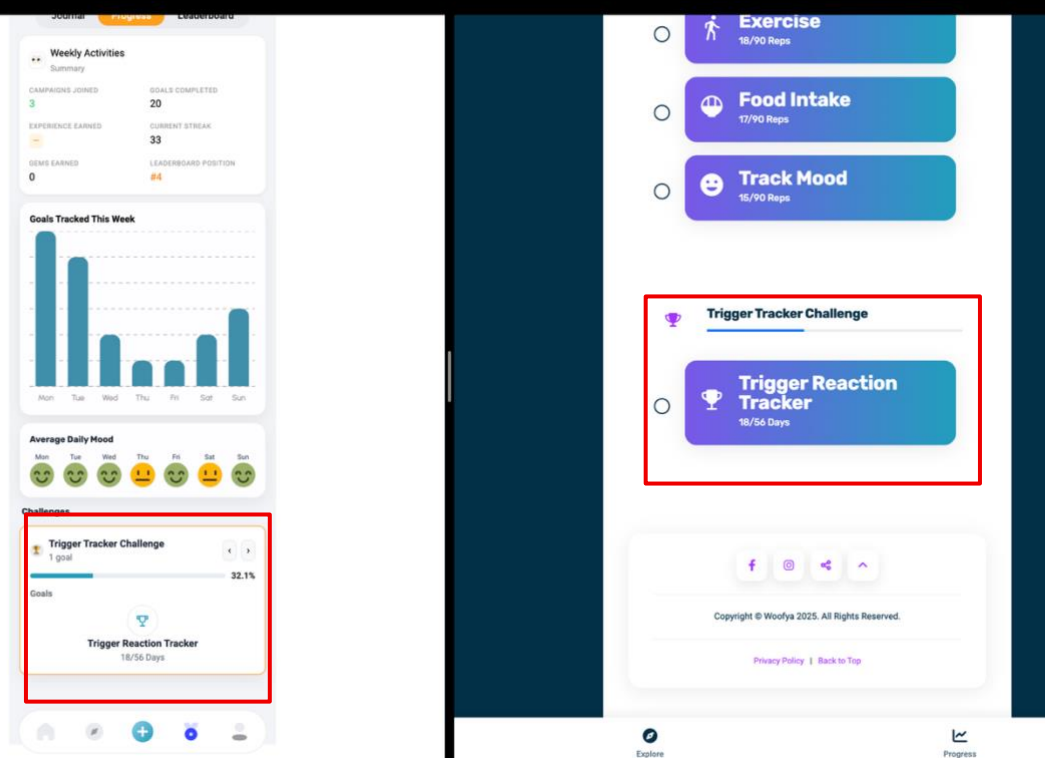

“Socialisation Challenge” Card:

We can identify that the goals in both cards (dashboard and progress) both match.

“Trigger Challenge” Card:

We can identify that the goals in both cards (dashboard and progress) both matches.

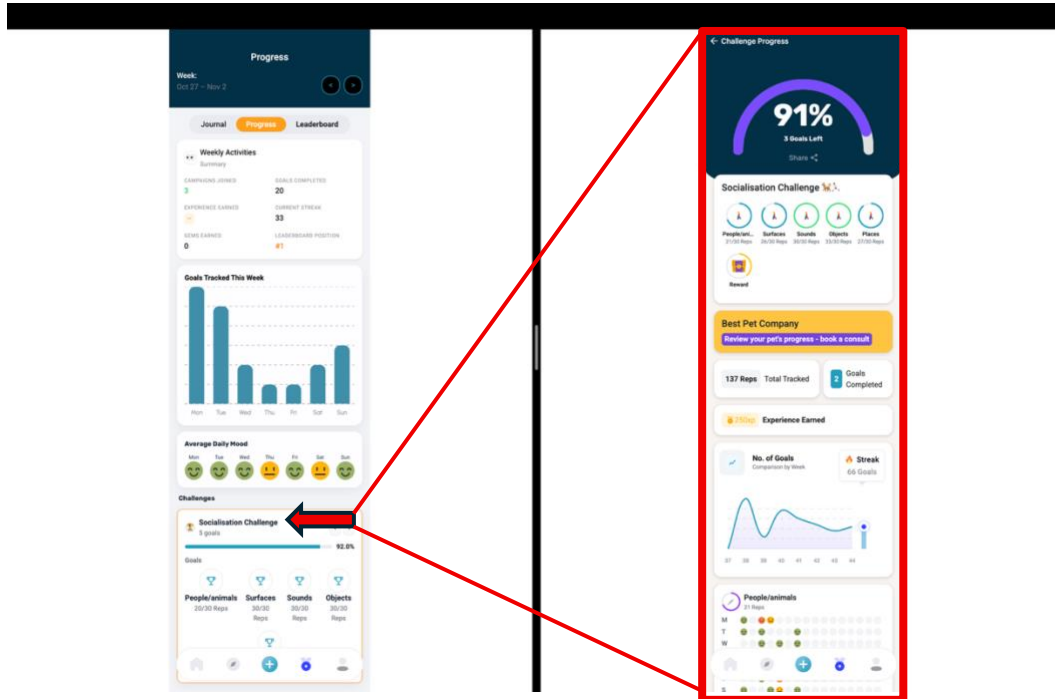

[14.0] Dynamic Navigation: Progress to Challenge Progress

In this test we're selecting a challenge from the list of signed up challenges and checking whether the localStorage can dynamically store the challenge the user has selected and populate the challenge progress tables with the goal, mood, and tracking data

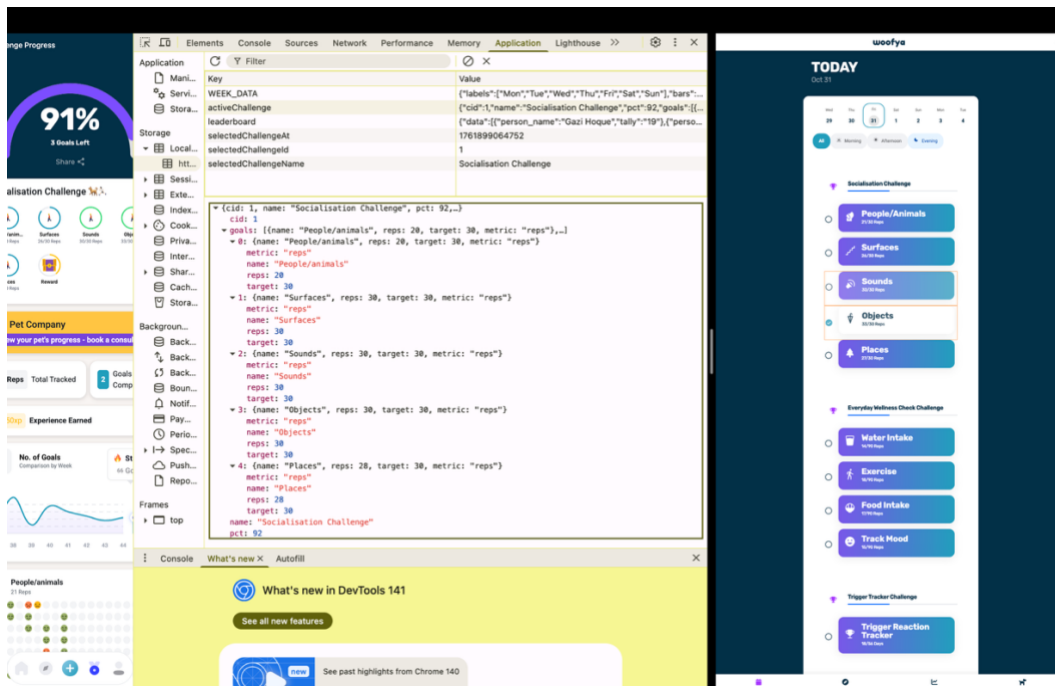

“Socialisation Challenge” Card:

We can identify the challenge progress page is populated specifically with its own data and challenges

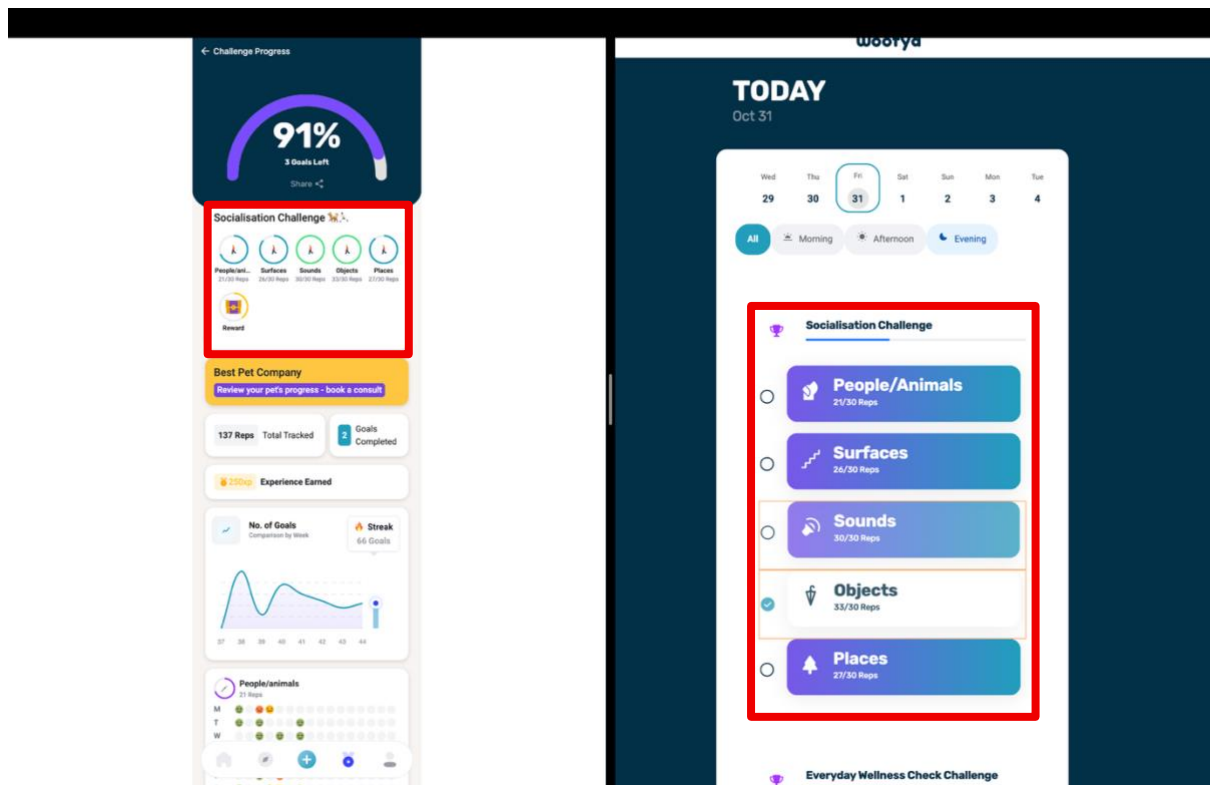

“Socialisation Challenge” Card:

Checking the localStorage to validate whether the data is being passed into the challenge progress page.

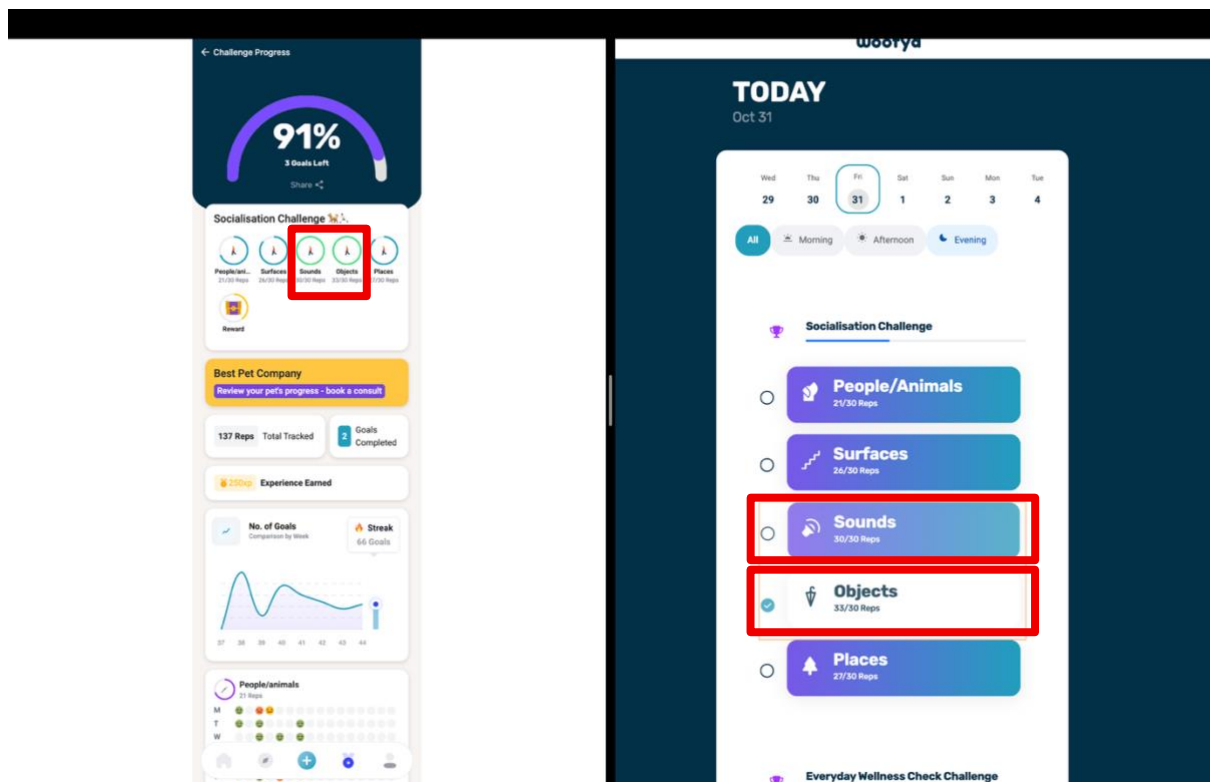

[15.0] Goal Cards: Challenge Progress

Matching the goal cards statistics to the dashboard

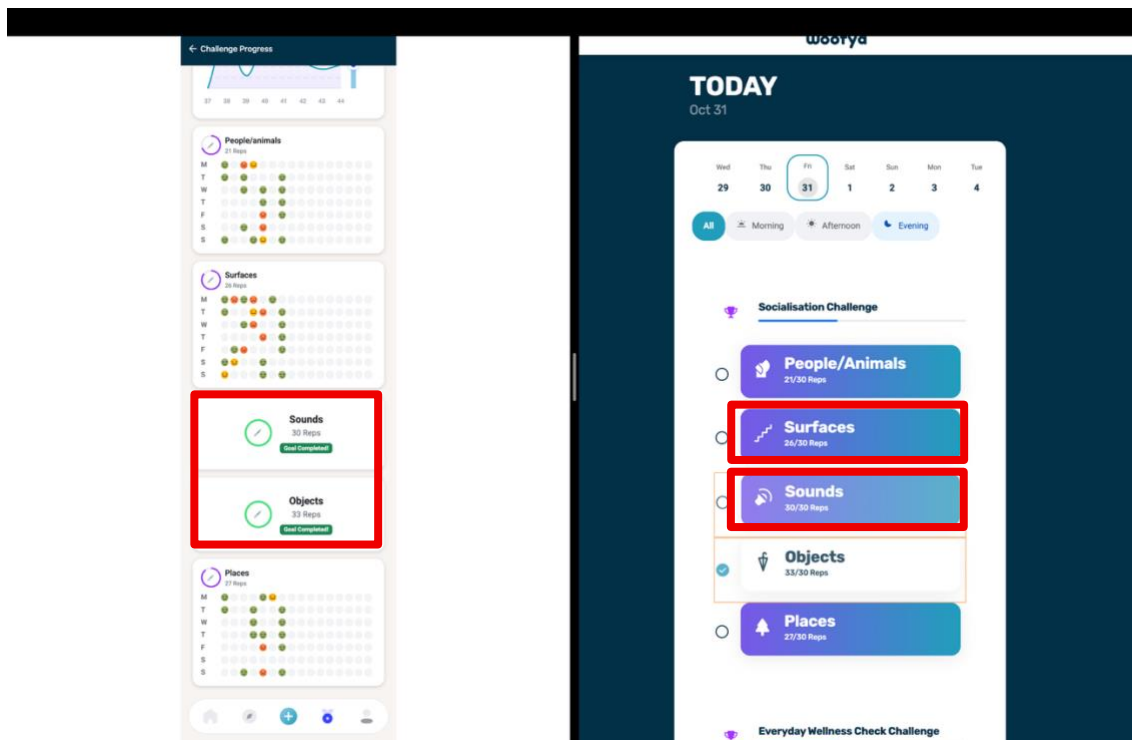

[16.0] Goals Completed / Reps: Challenge Progress

Matching the goal rep completion and goals completed with the finished challenges

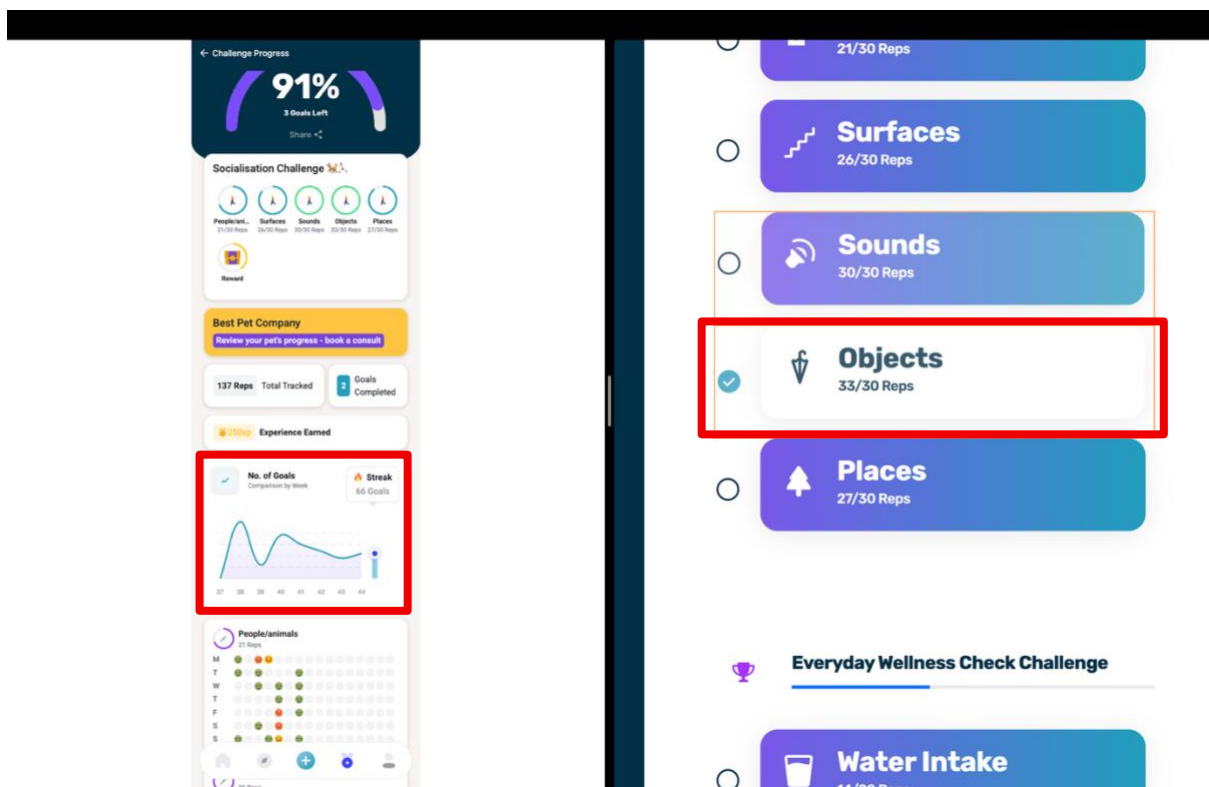

[17.0] Goals Completed Cards: Challenge Progress

When a goal is completed in challenge progress, a pop-up mentioning the goal is finished will show to the user.

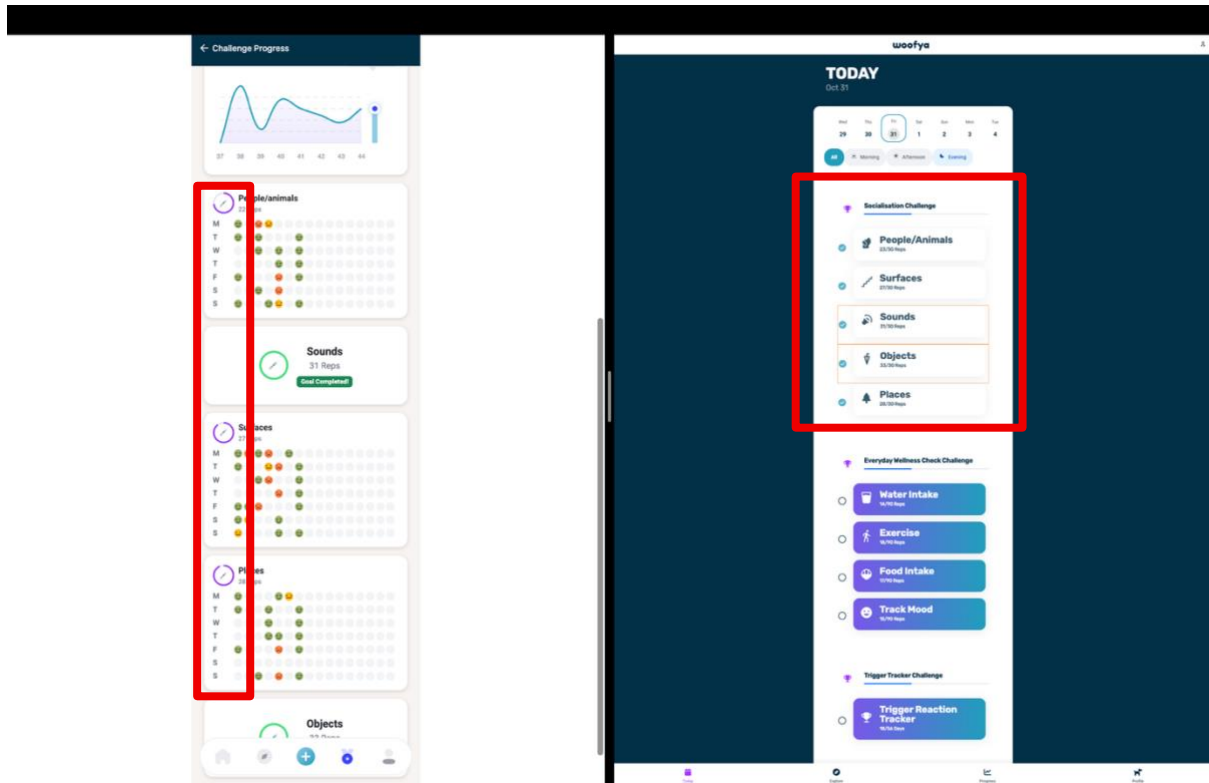

[18.0] Streak Chart: Challenge Progress

When a user completes continues to input goals into the challenge, the streak continues. Every day it increments by 1 till a day is missed. In this case, we have 1 goal completed today and the streak is incremented.

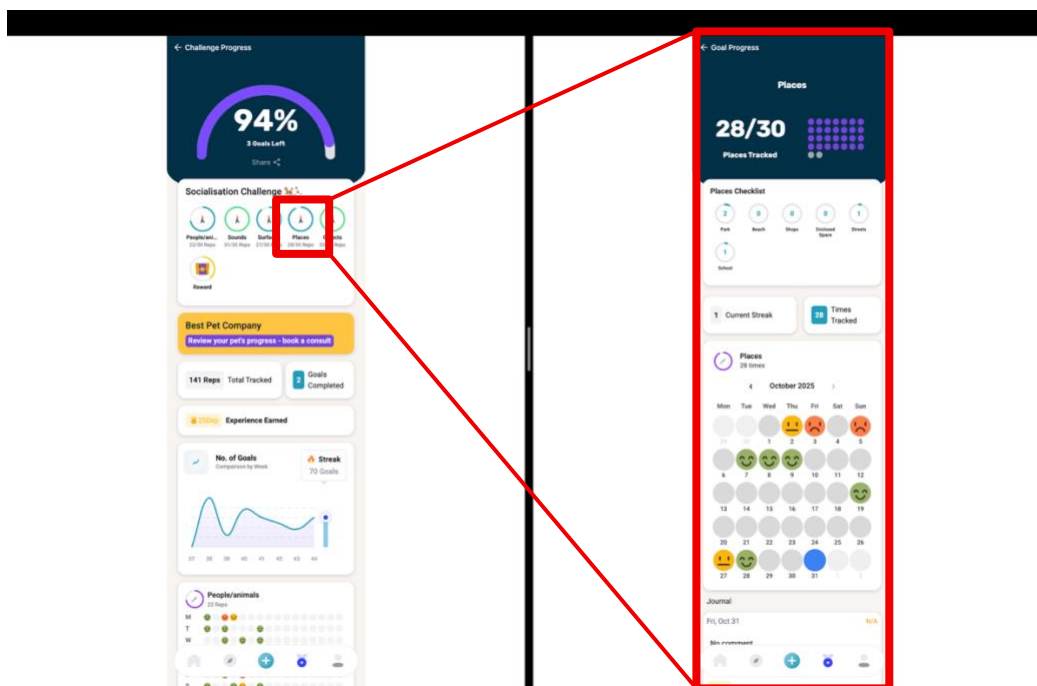

[19.0] Mood Chart: Challenge Progress

Each week is the furthest left column. In this instance we completed all goals (happy face, socialisation challenge) for the current week. It will reflect in the chart for “F” since it’s Friday.

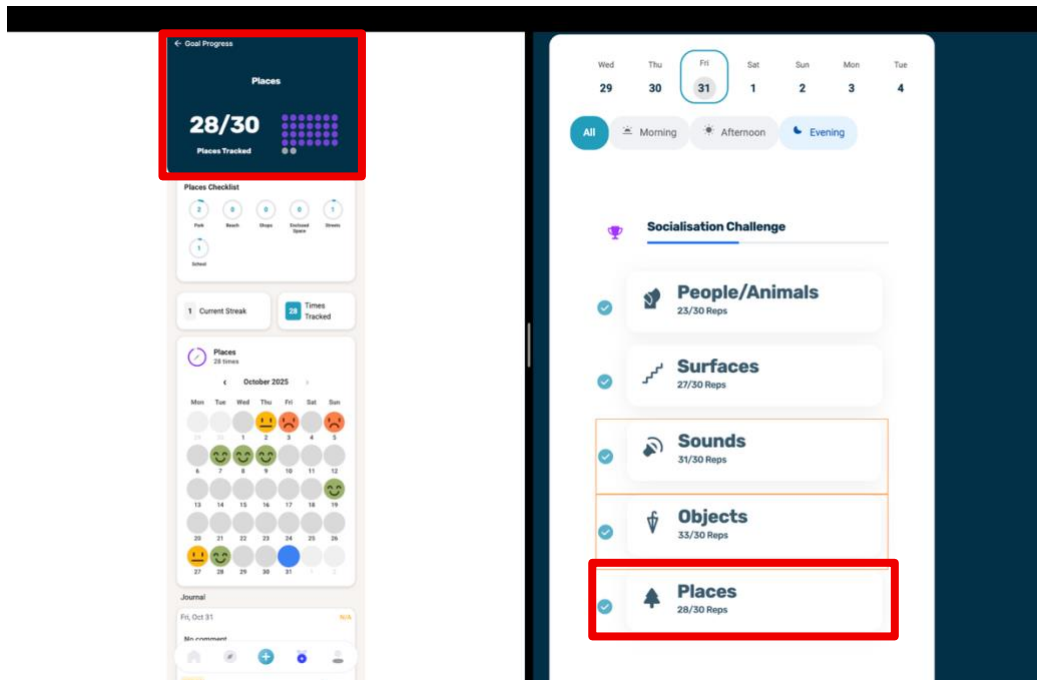

[20.0] Dynamic Navigation: Challenge Progress to Goal Progress

In this test we're selecting a goal from the challenge progress page and checking whether the localStorage can dynamically store the goal the user has selected and populate the goal progress tables with goal insights.

[21.0] Goal Navigation Tracker: Goal Progress

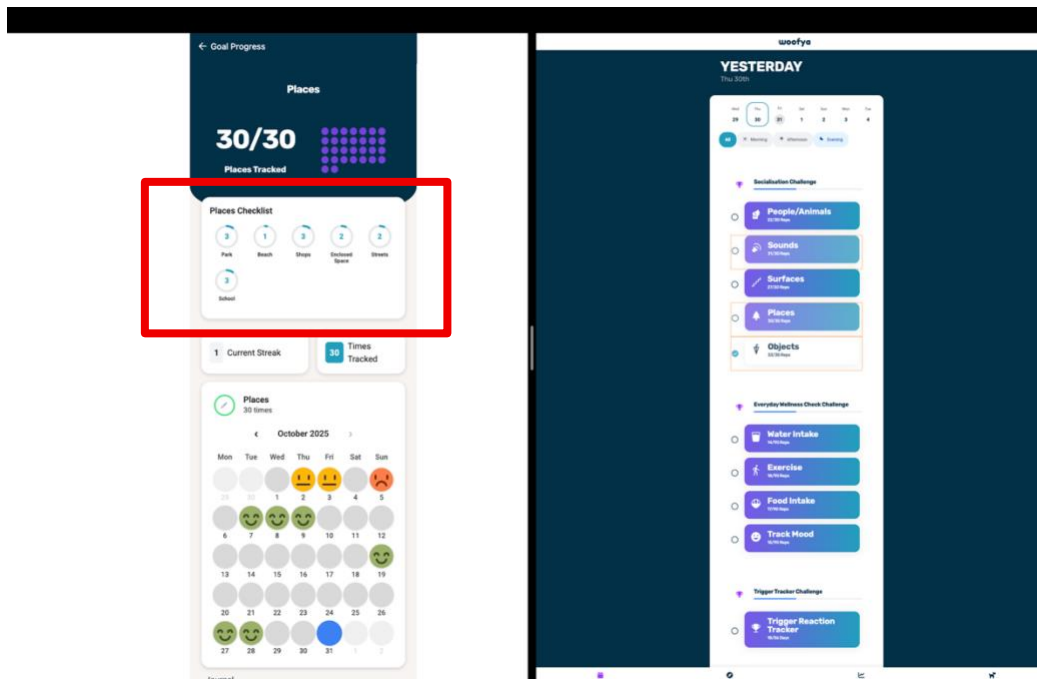

In this test we're seeing whether the reps, statistics, and dots shown in the goal progress page match the dashboard.

[22.0] Checklist: Goal Progress

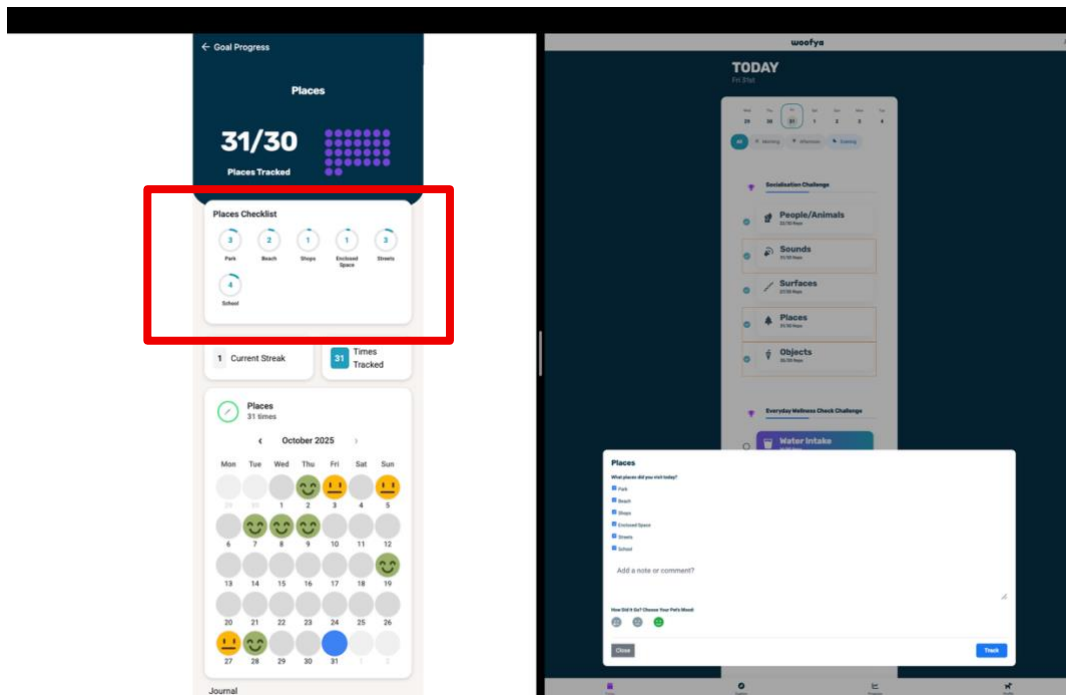

This component is difficult to demonstrate through the dashboard application.

Before: 30/10/2025:

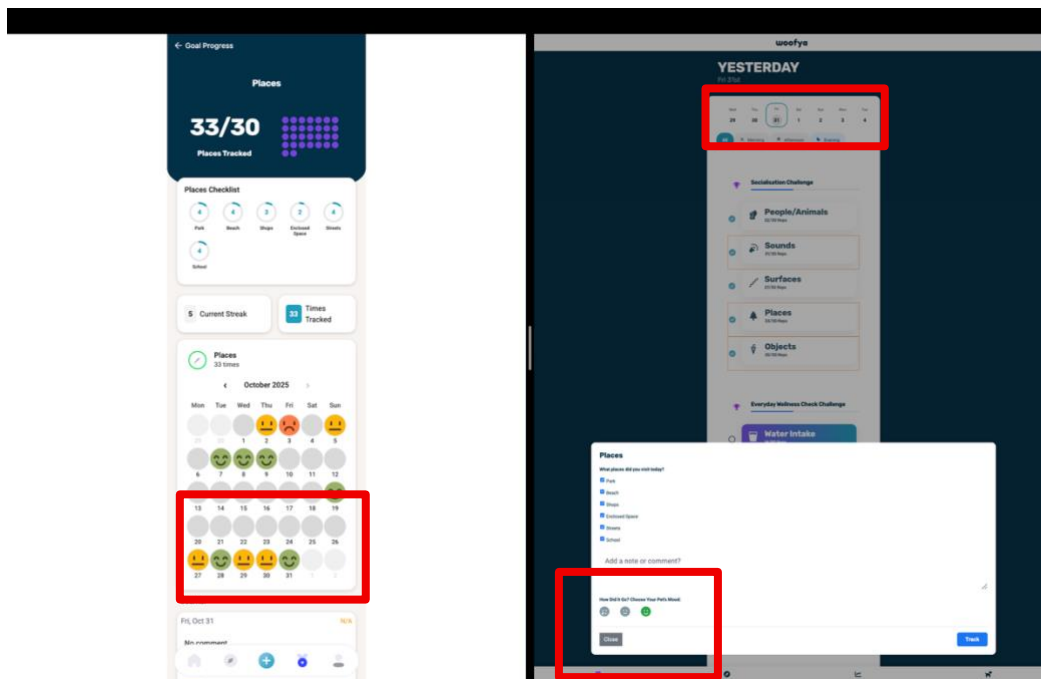

After: 31/10/2025:

Adding All items to the place's checklist 31/10/2025. You can see the difference before the before and after. They all incremented by +1

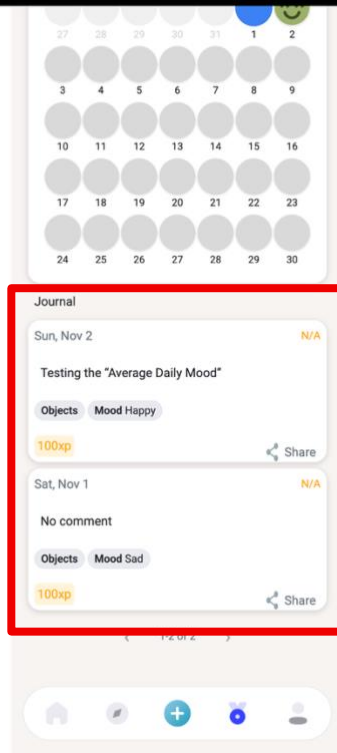

[23.0] Goal Mood Calendar: Goal Progress

In this test case, we're going to add a "happy" face to a place goal on the 30th of October. If a mood is set then the front-end goal progress page will update.

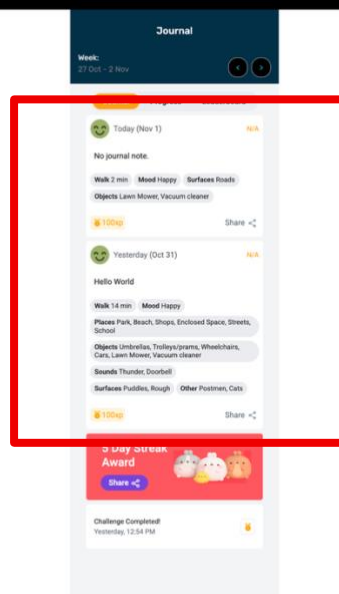

[24.0] Journal Entries: Goal Progress

In the journal entries entered reflects in the journal card

[25.0] Journal Entries: Journal

the newest journal entry for the current day is reflected in the front-end.

[26.0] Leaderboard Filtering: Leaderboard

Difficult to “Test” because this function is global for all users. We will show localStorage and the page. you can see how localStorage is capturing the tally and then how it’s represented in the front-end

The image displays a mobile application interface on the left and the Chrome DevTools Application tab on the right, illustrating how data is stored in localStorage and rendered in the UI.

Mobile App Interface (Left):

- Week:** 27 Oct - 2 Nov
- Navigation:** Journal, Progress, **Leaderboard**
- Users:** Unknown User, Gazi Hoque (1st), Test User (3rd)
- Rankings:**
 - 2nd: 9
 - 1st: 34
 - 3rd: 8
- Challenge List:**
 - 4: Unknown User, 8 Complete
 - 5: Unknown User, 4 Complete
 - 6: YI, 3 Complete
 - 7: Unknown User, 2 Complete
 - 8: Unknown User, 1 Complete

Chrome DevTools Application Tab (Right):
